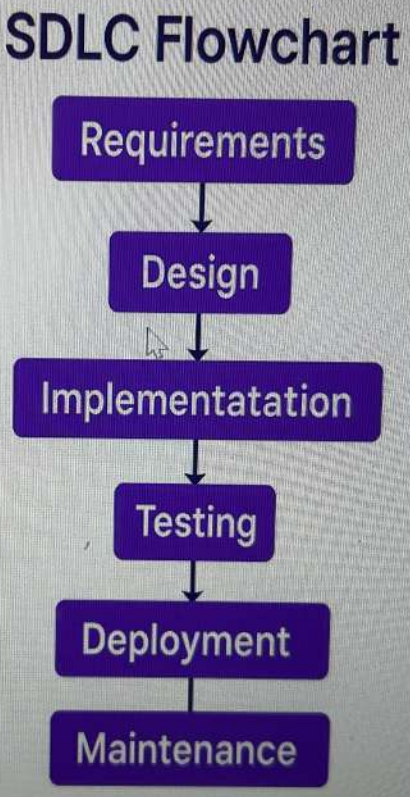
Activity1: SDLC



For Example:

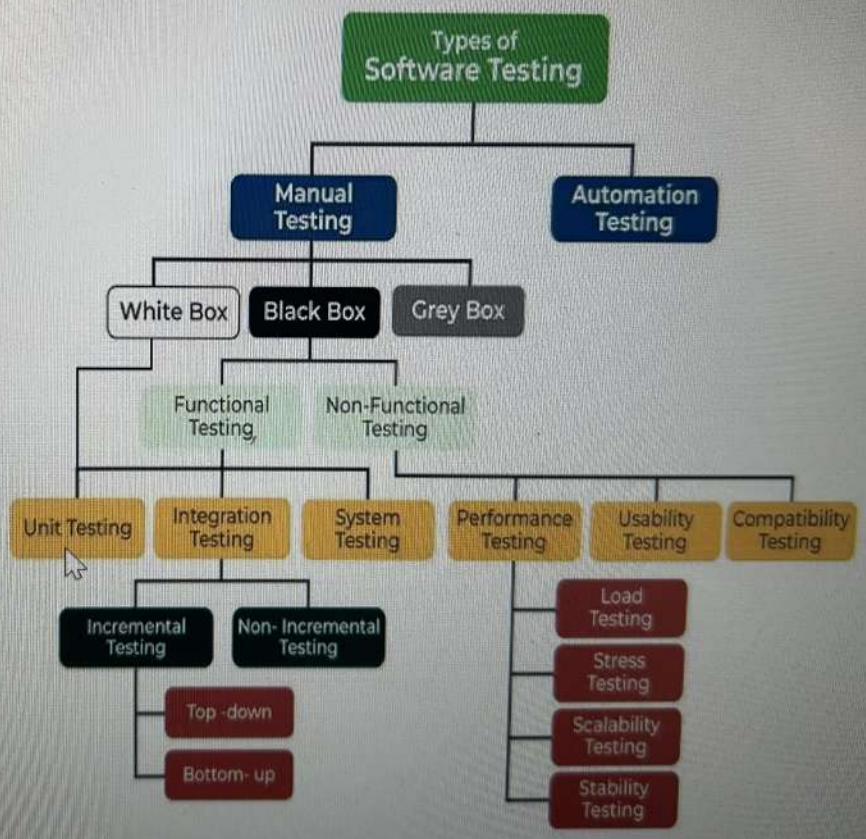
Medical Chatbot:

Activity2: STLC

Example:

Activity 3: Types of Testing:

- Manual Testing
- Automation Testing.



Activity-4:7 Principles of Software Testing

1. Testing shows the presence of defects, not their absence

Testing helps you *find* bugs, but it cannot prove that there are no bugs left in the system.

Testing helps find defects, but it can never guarantee the product is 100% bug-free.

2. Exhaustive testing is impossible

You cannot test everything (cannot test all the combinations). Instead, testing should be risk-based and prioritized to focus on critical areas.

3. Early testing saves time and cost

Fixing a bug during coding is like correcting a spelling mistake while typing.
Fixing it after release is like reprinting the entire book.
The earlier you test, the cheaper it is to resolve issues.

4. Defects cluster together

A small number of modules usually contain most of the bugs better cluster together.

5. Beware of the pesticide paradox

Activity-5: Amazon

Business Requirement Document (BRD):

- Users should be able to register and login.
- OTP verification should be required during signup.
- Users can search products by name or category.
- Products should show price, images, description, and ratings.
- Users can filter products by price and brand.
- Users can add/remove items from cart.
- Cart should show total amount including tax.
- Users can save items to Wishlist.
- Users can choose delivery address.
- Multiple payment options should be available (UPI, Card, COD).
- Payment should be secure.
- Order confirmation should be sent to user.
- Users can track order status.
- Users can cancel orders before shipping.
- Return option should be available within 7 days.
- Refund should be processed after approval.
- Users can rate and review products.
- Sellers can add and manage products.
- Admin can monitor users and orders.
- System should support multiple users at the same time.
- Data should be stored securely.
- Application should work on mobile and desktop.
